problem 7. a magical four-sided die is rolled twice. let  $s$  be the sum of the results of the two rolls. we are told that the probability that  $s = k$  is proportional to  $k$ , for  $k = 2, 3, 6, 8$ , and that all possible ways that a given sum  $k$  can arise are equally likely. construct an appropriate probabilistic model and find the probability of getting

3 the survivor function or survivorship function,  $s(t)$ , is the complement to the cdf and is defined as follows:  $(t) = 1 - F(t)$  for continuous time; or  $(t) = P\{T > t\}$  for discrete time. the value of the survivor function for an individual is the probability that the event has not yet occurred at time  $t$  (continuous) or prior to the close of observation period  $m$  (discrete time).
